

ABSTRACT OF THE DISCLOSURE

In a printer, in which printing is performed on a recording medium which is transported in a first direction, a carriage is reciprocally moved in a second direction which is perpendicular to the first direction. A print head is mounted on the carriage, and provided with a head face. A frame is placed in a first side of the print head. A guide plate extends in the second direction. The guide plate includes a first portion provided as a part of the frame so as to extend in a third direction which is orthogonal to both of the first direction and the second direction, a second portion continued from the first portion so as to extend in the first direction. The second portion supports the carriage so as to define a distance between the head face and the recording medium. The guide plate further includes a third portion continued from the second portion so as to extend in a fourth direction opposite to the third direction.
